Codetopia Mentorship Program - 2026

Git & GitHub

Session 6 :

Connecting to Remote Repositories

What we will cover today

- Linking your local repo to GitHub with `git remote`
- Pushing code with `git push`
- Pulling changes with `git pull`
- Clone vs Pull — understanding the difference
- Session Project: Remote Sync Challenge

Quick Review From Previous Session

- What type of SSH key did we generate, and what command did we use to test the connection to GitHub?
- You've generated an SSH key pair. Which key do you add to GitHub, the public key or the private key and why?
- In your Session 5 project, you setup ssh on your local pc. Explain in one sentence why SSH is more secure than using an HTTPS password.
- You've created an empty repo on GitHub. What is the very next thing you need to do locally to connect your existing project to it?

Connecting Local to Remote

Pushing to GitHub

Link your local repo to GitHub

```
git remote add origin git@github.com:username/repo.git  
git remote -v      # verify the link
```

Rename default branch to main (if needed)

```
git branch -M main
```

Push your code

```
git push -u origin main    # first push + set upstream  
git push                   # all future pushes
```

Pull your code

```
git pull    # fetch + merge in one step
```

Clone vs Pull

git clone	git pull
Creates the local folder and .git for you	Requires the repo to already exist locally
Copies an entire repo to your machine for the first time	Downloads new commits into an existing local repo
Used once; to get started	Used repeatedly ; to stay in sync
Sets up origin automatically	Uses the existing origin tracking

```
git clone git@github.com:username/repo.git
```

```
# first time
```

```
git pull
```

```
# ongoing sync
```

Session Project

Remote Sync Challenge

Session Project

Your deliverables

1. Push the Week 1 project to GitHub using `git push -u origin main`
2. Edit a file directly on GitHub (web editor), then pull it locally with `git pull`
3. Clone the repo into a new local folder and confirm the files match
4. Run `git remote -v` and screenshot the output showing the linked remote
5. Add a comment in one file explaining the difference between clone and pull
